News Desk

Laser's future in doubt

THE future of the Laser 200 computer now looks uncertain, following the collapse of its UK distributor, Computers For All.

The company formally notified its dealers last Thursday that "due to financial difficulties" it had ceased trading.

The crash could prove fatal for the £69.95 Laser 200. The machine has not been adopted by any of the major high-street chains, and software for the machine is in very short supply.

The Laser 200 has had a
Continued on page 5

CBM micros in UK by the summer

COMMODORE is to sell its new range of microcomputers — the successors to the Commodore 64 — in the UK by the early summer.

The most sophisticated of the new machines will be priced well under £400 although the choice of models to be offered in Britain has still to be decided.

There is more to Commodore's new range than the two micros — the 264 and the V364 — previewed at the CES trade fair in Las Vegas last month.

These machines are just two options from a whole range of computers. Using a modular design Commodore can produce a new micro with a choice of three types of keyboard and anything from 16K to 64K Ram, in 8K steps.

The three-figure code numbers for the computers denote the keyboard type in the first number and memory capacity in the other two. For example, the Commodore 116 has a calculator-type keyboard and 16K Ram. The 264 has a professional keyboard and 64K Ram while the V364 has a built-in voice synthesis, a professional keyboard with separate numeric pad, and 64K Ram. All of the machines are built around the 7501 processor chip — an 8-bit development of the 6502 with built-in video processor.

Commodore has chosen a modular design because computer markets around the world are at different stages of development and Commo-

How to submit articles

Articles which are submitted for publication should not be more than 3,000 words long. The articles, and any accompanying programs, should be original. It is breaking the law of copyright to copy programs out of other magazines and submit them here — so please do not be tempted.

All submissions should be typed and a double space should be left between each line. Please leave wide margins.

Programs should, whenever possible, be computer printed.

We cannot guarantee to return every submitted article or program, so please keep a copy. If you want to have your own program returned you must include a stamped, addressed envelope.

Accuracy

Popular Computing Weekly cannot accept any responsibility for any errors in programs we publish, although we will always try our best to make sure programs work.

Editorial

THE announcement that Timex will neither manufacture Sinclair's QL computer nor market it in the US has led to speculation that the three-year association between the two companies may be nearing an end.

Yet the reason Timex will not manufacture the QL is a technical one. Timex's plant in Dundee would not have been suitable without considerable further investment in the site — a step Timex are unwilling to make.

As for the reason the QL will not be sold by Timex in the States, most observers point to Timex's poor handling of the previous American Sinclair machine, the 2068 version of the Spectrum. By dithering for almost a year Timex has denied the 2068 wide distribution and, by early December, only around 40,000 had been sold.

Timex proved to be too big an organisation to move quickly, and speed — as others like Atari and TI have found to their cost — is vital for a successful micro company.

But it is not Timex's performance which has been the main deciding influence on Sinclair choosing to sell the US QL itself. The reason for going it alone is simple: Sinclair is a far stronger company now than it was two years ago and — never shy of a challenge — it now wants to see if it can crack The Big One.

Unfortunately, Timex's record with the 2068 will not have helped Sinclair's job of selling the QL in America.

And Timex, without the QL, seems unlikely to be able to continue as a force in the micro world, except as an assembly facility.

Next Thursday

You must guide your unarmed robot around the screen, avoiding the deadly red blocks — at the same time you are being followed by a red droid. Follow — next week's game for BBC model B by Andrew Pfahler.

AGF

PROGRAMMABLE JOYSTICK INTERFACE for Spectrum or ZX81

MICRODRIVE
COMPATIBLE

ONLY
26.95
+£1.00p.p

AGF PROGRAMMABLE INTERFACE

Recognised as the only true Hardware Programmed joystick interface this product offers all the features associated with such a design.

You can use *any* Atari-compatible joystick controller with *any* software for your Sinclair Spectrum or ZX81, not just those with a joystick option.

Movement of the joystick is recognised by the computer *exactly* the same as pressing the appropriate control keys, and can therefore give the most immediate response to that movement. The hardware programmed design works with *all* possible key-reading methods, both BASIC and Machine Code.

Eight directional movement, with or without the fire button being pressed, can be achieved by only programming the left, right, up, down and fire keys required by the game.

Programming is achieved by a two-digit code, which is looked up on the Programming Chart supplied, for each direction and firing button. These two numbers are then selected on a pair of leads which are clipped onto appropriately numbered strips on the interface.

Once configured this can be marked onto a Quick Reference Programming Card for storing with the game. As the programming is *not* power dependent the interface can be immediately used when next switched on.

The keyboard remains fully functional and can be used simultaneously with the joystick.

An integral rear expansion connector means there is no need to remove the interface to connect other peripherals.

NB. A recent design improvement now means that the AGF Programmable Interface works with the new Quickshot II rapid "Auto Fire" feature.

KEY FEATURES

- ★ Programmable design gives TOTAL software support.
- ★ Accepts Atari, Competition Pro, Wico, Starfighter, Quick Shot, Le Stick etc.
- ★ Rear extension connector for all other add-ons.
- ★ Free demo program and instructions.

PACKAGE CONTENTS SUPPLIED

- Programmable Interface Module as illustrated, complete with clip-on programming leads.
- Self adhesive programming chart detailing how to define which key is simulated by UP, DOWN, LEFT, RIGHT, and FIRE.

- One pack of ten Quick Reference Programming Cards for at-a-glance setting to your games requirements.

- 12 months guarantee and full written instructions.

Off the board for Scrabble

BOARD game makers Waddingtons and J W Spear have teamed up with a new company — Leisure Genius — to produce microcomputer versions of their famous titles.

This follows a first successful venture by Leisure Genius' associate company Little Genius last year — the top-selling program of P Spear's *Scrabble* for the Spectrum. That project was programmed by Psion and marketed by Sinclair. Now, Leisure Genius has established its own programming team to develop *Scrabble* for other computers. A Commodore 64 version will appear in March, to be fol-

lowed by a BBC Model B program.

In what appears to be a major change of policy, Waddingtons has also signed up with Leisure Genius. Waddingtons had previously seemed to view micros as a threat to its board game trade rather than as a new development in games.

Leisure Genius will sell a version of *Cluedo* for the Commodore 64 in March, to be followed by a Spectrum conversion in May.

The company is also to sell a micro title based on the Invicta game *Mastermind*.

All programs will sell for

between £7.95 and £14.95.

Says Peter Deutsch, managing director of Leisure Genius: "What we are doing is an extension of what Melbourne House has done with *The Hobbit*. We now have considerable experience of dealing with board game manufacturers and we see ourselves very much as an extension of those companies.

"We also hope these relationships will continue. For Waddingtons we are currently developing computer programs based on their new range of pre-school educational toys."

Laser 200

Continued from page 1

chequered career. It is one of a number of machines — including the Comex 35 — designed and built by a Hong Kong-based company, Video Technology. It made its first appearance in an earlier guise as the Textet. Then Video Technology linked up with Leisure Zone to promote both machines to be distributed by Computers For All.

In the middle of last year Leisure Zone and Video Technology parted and Computers For All became sole distributor for the Laser 200 and Comex 35 computers.

Computers For All — the trading name of Moranbrook — was formed by Jeff Weinrich in 1980 and began by producing software for the ZX80. The company switched to retail distribution of computers, beginning with the Dragon, Oric and more recently the Tandy Model 10.

First deliveries of the Laser through Computers For All began in September 1983.

Commodore

Continued from page 1

dore's many subsidiaries each have different requirements for a new machine.

It has apparently still not been decided which machines from the range will appear here in the early summer. Commodore UK is known to be keen on the 116 machine as a competitor for the Sinclair Spectrum. It also seems likely that the 264 will be sold in Britain.

Single-board 6809 system for BBC

SOMEWHAT in advance of Acorn's own expected Z80 and 6502 second processors for the BBC micro comes a single-board 6809 system from Cambridge Microprocessor Systems.

The board can either sit inside the machine connecting via the tube interface or be connected using a Eurorack if expansion of the 6809 bus interface is required.

Once installed, the system allows disc software written for the Flex operating system to be run on the BBC — including a number of high-level languages like PL9, C, BCPL, Forth and Fortran.

The 6809 system includes a monitor Rom and a BBC Basic program on disc to link in the new processor card. The price for the board is £249

Speech cartridge for the 64

COMMODORE is working on a Text/Speech cartridge for the Commodore 64.

The software Rom will plug into the Magic Voice sound synthesiser unit and convert text simply keyed-in to speech.

IBM college scheme

IBM has announced a £400,000 scheme to provide colleges with microcomputers.

Ninety-two selected universities and polytechnics will each receive a free IBM PC machine under the plan.

and the Flex operating system costs another £130. Details from Cambridge Micro-Processor Systems, 11 St Margaret's Road, Girton, Cambridge.

Macintosh micro from Apple

APPLE has formally announced its new Macintosh computer.

It offers the same window graphics and 'mouse' cursor control as Apple's Lisa machine, but at around a third

of the price.

The Macintosh uses the 68000 processor, from the same family of chips as that used in the new Sinclair QL.

It has a built-in 9-inch black-and-white screen, single 3½-inch disc drive, 128K Ram, 64K Rom, built-in clock, and external disc, RS-232 and RS-422 interfaces.

The machine will sell in the US for between \$3,000 and \$3,500. It is expected to arrive over here in April, priced around £2,500.

Century collapses

CENTURY Electronics, the only UK company designing arcade game machines, has gone into liquidation.

The company, based in Manchester, was the largest originator of coin-operated video games outside Japan and the US.

It was best known for the development of one of last year's most successful arcade titles — *Hunchback*. The game was also successfully licensed to two home computer software houses — Superior Software for the BBC version and Ocean for the Spectrum, Oric and Commodore 64 conversions.

Century was one of the first arcade game companies to licence its titles for home computers and its managing director David Jones campaigned vigorously against unauthorised home computer versions of coin-operated games.

Phillips talk to Atari

WISSE Dekker, President of the Dutch electronics giant Philips, has confirmed that his company has been involved in talks with the troubled US microcomputer manufacturer Atari, concerning a number of possible joint ventures.

The preliminary discussions have dealt mainly with Atari's interests outside the US. Under consideration has been the possibility of a joint venture in Europe to expand Atari International and the idea of a research effort by the two companies to develop video-disc games using Philips' Laservision technology.

Both Dekker and Atari's chief executive James Morgan have denied rumours concerning a possible takeover of Atari International by Philips (see *Popular Computing Weekly*, December 15).

Over the last nine months Atari has produced a deficit of over \$500m.

IT'S HERE. ANDROID TWO IN 3D.

A NEW DIMENSION IN EXCITEMENT FROM VORTEX SOFTWARE.

Stop the advance of the Millitoids. Survive the maze of death, rationalise the paradox zone and overcome the dangers encountered in the flatlands.

Ideal language

I write in response to Jeremy Ruston's outline of an ideal high-level language (*PCW* 12-18 January). The @ indirection operator he describes is in fact simply the Spectrum's *Val* function! The Spectrum does *Val x\$* by looking at *x\$* and using it as an indirect pointer to the variable or other expression whose name is written there. If the expression is a string you must of course use *Val\$* provided by Sinclair for this purpose. The method can be applied to any depth.

My own ideal language would be a sort of hybrid of BBC and Spectrum Basic — it should have the huge array of structures provided on the BBC, but also the unique flexibility of the Spectrum's interpreter which manages to understand things you intuitively feel Basic ought to understand, like *Goto* variable, *Gosub* variable, and so on. Do any other readers have views on what they would consider an ideal language?

Very average

I'm getting sick and fed up with your correspondence on high scores on Arcade-style games. I'm very average indeed at these games and I'm proud of it.

I mean what imaginative person wants to go through the repetitive motions of playing a game just to achieve 999,990.

Surely the game ceases to be a challenge at around the 100,000 mark. Personally I prefer adventures, it took me just over eight hours to complete the excellent *Black Crystal* — beat that, arcade junkies!!

Gareth P Jones
6 Victor Road
South Kirkby
Pontefract
W Yorks
WF9 3DF

If any arcade junkies can beat that, perhaps they would just like to smile knowingly to themselves.

Down under

In a recent issue of *PCW* Andy Wilson asked what a Bunyip was. Well, it's a creature of Australian Aboriginal folklore. The story is (roughly) this: the Bunyip lived with its mother at the bottom of a deep pool but was kidnapped by some Aborigines. I think its mother was something to do with water or rain. Anyway she got a bit upset and nasty and got her Bunyip back. I can't remember why, but now Aborigines treat some waters with respect.

Commodore tip

Here is a tip for Commodore 64 owners: Whilst it is true that you cannot enter more than two lines

"We'd better settle the matter before we begin manufacturing"

A mirror image on screen

I've seen a program in a past issue of your magazine that copies a third of the screen of the Spectrum to the middle. The author of the program suggests that a routine like this could be used to produce a mirror image of the top third of the screen to the bottom third.

On writing such a routine, I decided that it was too slow to use usefully in a program. However, the following machine code routine provides an almost instant reflection of

the top eight lines to the bottom eight. This leaves eight lines in the middle as the routine uses the bottom two lines not normally available in Basic.

The routine is totally relocatable, making it suitable for both 16K and 48K Spectrums. To activate, type *Randomise USR 'start address'*.

David Channon

Andy Pennell writes: The answer depends on which model of Spectrum you have. In models one and two there is a line marked *Video* on the PCB which you simply have to connect up to the edge connector with a blob of solder. Most model threes already have this connection made. Once done, simply hook up a lead from the edge connector to the monitor.

Ace enthusiasts

In reply to John Noyce's letter regarding the Ace Users' Club, what I and many Ace users want is an independent club, where ideas and programs can be exchanged freely. We do not want a club that is just a front for a software house trying to boost its sales.

More power to Phil Murray — let's get the Ace Club for Enthusiasts on the road.

Sadistic preview

I read with great interest Andy Pennell's preview of the Sinclair QL. As a Spectrum owner I was particularly interested in his comments concerning provision on the Spectrum for a colour composite monitor. How sadistic can you get!

You fed me the sprat and left the mackerel unhookable! Please put me out of my misery, document the undocumented and tell me what needs to be done to hook up my Spectrum to a colour composite monitor.

To change the subject I do agree with Steven Mason that you tend to concentrate too much on games and not enough on more serious software. I think there are more of us using our micros for things other

MY SECRET FILE

Program by Phil Nathans

Based on the best-selling Puffin book by John Astrop

A personal database for your darkest thoughts.

Do you have secrets you wouldn't even confide to your closest friend? Let alone your family?

Do you have secrets about your friends and family you wouldn't confide to anyone but yourself?

At last, you're no longer alone. **My Secret File** turns your personal computer into a personal confidante. And to keep your confidences confidential, it's even password protected – because these days, you can't even trust your micro not to blab.

Trust no-one: file your friends before they file you.

THE UNORTHODOX ENGINEERS: THE PEN AND THE DARK

Adventure game program by Keith Campbell
Based on the story by Colin Kapp

Colin Kapp created the classic SF stories about the Unorthodox Engineers – and now you can try to solve the mystery of the indestructible pillar of darkness and the riddle of contra-energy in this mind-bending text adventure game.

Reading Colin's story in this pack should help you. But once you and your micro are locked into the problem, not even Colin could get you out.

By special arrangement with an unspecified alien culture, Mosaic will let you have the story along with the program – so at least you're in with a chance.

Please read the story carefully... because we'd like to release our Spring SF bookware blockbuster (Harry Harrison's Stainless Steel Rat on micro for the first time!) before you carelessly unleash contra-energy across the universe. Thank you.

Available for the: **Spectrum 48K** ISBN 946855 15 3 **BBC Micro B** ISBN 946855 20 X

Available from good bookshops and computer stores.

Bandit

A new game for 16/48K Spectrum by K Deakes

Bandit is a fruit machine for both the 16K and 48K Spectrum which has all the features of the real thing, except, of course, actually paying out. It is written in two parts in order to fit it into the 16K machine, which would otherwise be difficult.

You begin with £1 and each go costs 10p. Apart from just spinning the reels, there are also random hold and nudge features indicated by relevant noises and flashing lights. The holds allow you to hold any of the reels on the following go by pressing keys 1, 2 or 3 as appropriate. Before a reel can be nudged, key N must be pressed to determine the number of nudges available. Then, by pressing keys 1, 2 or 3 again the reels are nudged until a win occurs or your quota has been used. There is also the option to cancel holds and remaining nudges. If required, instructions are displayed as necessary.

Listing 1 is the main program and should be typed in first and then Run to Save.

After *Verifying* it, stop the tape and type in listing 2. When Run, this program will *Save* the user defined graphics, arrays *a\$* and *c*, and screen, and these should be *Saved* on tape just after the main program. Finally, the program will *Save* itself as a precaution. Everything should now *Load* automatically.

Notes:

Listing 1

Lines:

10 Saves the program to run automatically on loading
40-110 Start the game and take it through the various subroutines
500-540 A series of For-Next loops to 'rotate' the reels and to check which parts of the arrays (*a\$* and *c*) are in use
700-880 Since SCREEN\$ cannot be used for distinguishing user defined graphics on the screen, the display file is PEEKed to check for a win
900-1250 Nudge subroutine. Line 900 determines if there is to be a nudge. Lines 1000-1100 determine the number of nudges and lines 1120-1250 count the nudges used and

check which keys are pressed
2000-2130 Hold subroutine, checking keys pressed and taking the appropriate action
5000-6200 Win subroutine, working out the win and new credit total
6300-6320 Play tune during win
7000-7040 Reduce credits and check if there are any left
8000-8030 End of game subroutine
8040-8050 Clear instructions
9000-9100 Load graphics, arrays and screen. Set up the variables and give the options of instructions. Poke 23658, 8 sets Caps Shift on

Listing 2

Lines:

10-430 Draw Screen. This includes six user defined graphics in line 280 which are graphics ABC and DEF respectively. The graphics in lines 350-400 are part of the main graphics set shown below, and those in line 120 are alternating graphic 8s and shifted graphic 8s
500-570 Define user graphics using one For-Next loop
600-740 Set up arrays defining the reels. For graphics see below
750-780 Save relevant parts of the program
790 Saves the program itself

BLASTERMIND

SPECTRUM 48k £5.95

At first glance this might seem to be just another version of a very popular game. How wrong can you be!!! True, the start is simple enough. The Spectrum picks a code of numbers or colours with a selection of levels of difficulty — and invites you to do the same. You then take it in turns to guess each others code from the clue supplied after each guess. An extremely well written, fast and very clearly displayed game, with almost inevitable defeat.

This was exactly as intended but unfortunately *something went wrong*. During the programming strange complimentary messages began to appear on the screen. At first they were so few they were not taken too seriously, but soon they could no longer be ignored. Somehow the Spectrum had been given a personality — a rather devious, supercilious, dislikeable, hateful, horrible mind.

* Side B contains a version of the game compatible with the excellent Currah µSpeech unit — even worse!! *

THE QUEST OF MERRAVID

VIC 20 (16k) £7.95
or Commodore 64 £7.95

A really challenging and enjoyable adventure, written by a confirmed adventure addict who grew tired of the ease with which he solved other adventures himself. Will accept and act on sentences containing up to nine words.

The adventurer becomes Merravid, charged with the task of finding, taking and then returning the magic Firestone of the Dwarves. However, overcoming the many novel and original hazards is no easy matter. Careful and imaginative thought is required if progress is to be made and the Firestone tracked down to the lair of the Dragon of Thargon. Even then the Dragon has to be defeated and the stone retrieved. A compulsive, extremely enjoyable and very user friendly adventure.

HARRIER ATTACK

any ORIC - 1 £6.95
any SPECTRUM £5.95

Pure machine code, super-fast, action-packed, highly addictive arcade-style game requiring great skill. The harrier takes-off from an aircraft-carrier and flies over seaborne defenses to attack enemy installations on a nearby island. The harrier may fly faster, slower, higher or lower, and has bombs and cannon fire with which to protect itself and make its own attack. If it flies too high it is detected by enemy jet-fighters (which it may counter-attack) — so it needs to hug the mountainous terrain which also varies with every new game. But the island is heavily defended by anti-aircraft rockets and tanks, which again the harrier may counter-attack or try to fly through. A tally is kept of fuel, speed, altitude, ammunition, plus player score and high score. Finally the harrier must make its bomb-run over the enemy base before returning past more hostile shipping to its own carrier.

DURELLSOFTWARE

SCUBA DIVE

any ORIC - 1 £6.95
SPECTRUM 48k £5.95

Pure machine code with super cartoon graphics. You are in control of a diver who must swim down through jellyfish, sharks, barracuda and a host of other under-sea nasties to locate the entrance of a submarine cave. He must then follow its twisting and branching passages which change with every new game, to locate the magical giant oysters with their fabulous treasure of enormous pearls. Many of the passages lead to dead-ends, while some are filled with horrible underwater monsters. Each dive has to be timed carefully so that there is enough oxygen left for the return journey, which is further frustrated by the diver's boat shifting anchor and threatening to decapitate him with its propellor. This game which features three divers, player score, high score, hall of fame and sound effects, presents perhaps the ultimate epic arcade adventure.

DURELLSOFTWARE

— ALSO —
AVAILABLE

JUNGLE TROUBLES — frustrating, addictive, funny, silly. Come back Tarzan — all is forgiven! SPECTRUM £5.95

Enter the Dragon

Brian Cadge picks his way through a New Year selection of Dragon software

At the recent Christmas fair at Wembley, a lot of new Dragon software was on display, not least from Dragon Data themselves who have recently released new titles in new style packaging. Most of these titles have been licensed from US software houses which write for the Tandy Coco, and the two featured here are no exception.

Shift is a game originally written by Prickly Pear Software which includes high resolution colour graphics and a little sound. The game begins by requesting skill level to be entered via the joystick — there are only two levels and these don't differ a lot. The title display is only black and white, but is a very impressive use of mode 4 graphics.

On to the game itself. Across the screen are eight lifts, moving up and down at various speeds. Your job is to negotiate the lifts, avoiding all but the last one which is yellow and which moves you up to the next floor. The sound effects are a bit half-hearted, but the graphics (mode 3) are not bad, especially the player's cowboy (why he is a cowboy is not made clear). If you do manage to reach the top right-hand corner of the screen, a parachute opens to

maze game! Escaping from your cell on the alien ship, you roam the many corridors collecting laser guns, etc, hoping ultimately to find the way out. Joysticks cannot be used, as all commands are entered via the keyboard as in *Open, Take, Search*, etc. The main problem I had was that I couldn't pick up anything — typing *Take Lasergun* when one is hanging on the wall resulted in nothing happening! Maybe I am missing something, which is not surprising as the manual is not exactly detailed.

The sound effects are quite good, but as in *Shift*, the graphics could have been better, and they are nowhere near as smooth as *Escape*, the 3D maze game from Microdeal.

Dragon Data's new packaging is in giant 7" x 9" plastic

shapes instead of colours. After such a good start to the game, it was disappointing to find this as the finale. If he fails to find the correct combination in time, the princess gets the knife, if he succeeds the game restarts.

Castle Attack seems to have been hastily finished off, a bit more sound, a better end to the game and an option for joysticks would make this very good game into an excellent one. In any case, at the reasonable price of £6.50, this piece of software is still a worthwhile buy.

Super-Spy is a "modern history simulation" in the Cheshire Cat educational series. It contains two double-sided cassettes neatly packed with an instruction

bring you back to the bottom to start all over again.

Although *Shift* is quite an original game and enjoyable at the beginning, the novelty soon wears off when you realise that getting to the top depends more on the random arrangement of lifts than on the player's skill. The graphics could be a little less fuzzy and so could the sound.

The second game featured here from Dragon Data is *Cimeeon Moon*. The back of the box enthuses: "A real time sci-fi adventure set in deepest space — fantastic 3D graphics and surrealistic sound effects create this weird and wonderful experience."

Well, you'll have to use your imagination a bit to go that far as this is yet another 3D

boxes with full colour inlays, manuals and space for two cassettes and a disc. This is certainly impressive, especially when the games are still only £8 each, but remember it is the software not the packing that counts!

Castle Attack from M & D Systems is another arcade game using hi-res colour graphics, but very little sound. The

program is a hybrid of Basic and machine code which seems to run at quite an acceptable speed.

Side one of the tape contains only instructions and title screens, while side two contains the game itself. The graphics are quite outstanding, my only grumble is that the keyboard has to be used with no option for joysticks. The object of this game is to guide our hero round the castle walls, collecting three coloured keys in the correct order, and avoiding the barrels being tossed at him from the battlements and the arrows from the windows.

Once all three keys are collected, you enter the castle to rescue the princess. To do this, our hero is confronted by yet another version of *Mastermind*, using

card. The front of the box has the familiar red Dragon logo with the usual wording and looks more like a Dragon Data program than bona fide Dragon ones do!

Part one of the software starts with an assault course in black and white graphics in which you must duck and jump over various obstacles to get on to the next section of the program where facts about wartime Britain are thrown at you, followed by ten questions for the 11-year-old to answer. Get five right and you go on to the parachute game. This particular game section has got to be the most boring and monotonous of its type I have ever seen. If you stick it out, a code letter is given to help you later on in your secret mission. The programs continue in a similar vein from here on.

By now you will have realised that these programs attempt to educate youngsters while keeping them interested with games in between the facts. Unfortunately, the games are of a very low standard indeed and would have trouble keeping a five-year-old amused, let alone an average 11-year-old.

Super-Spy is a good idea which could have been rather better. In its present form, the average parent will not want to pay out £20 for it.

For those users who love playing maddening word puzzles in newspapers, where a number of words are hidden in a word grid, there is *Searchword* from Temptation Software. The program allows

words from three to 12 letters to be entered and will then produce a word grid for you to play on. The words can be saved and loaded from cassette and there is also an option to list the concealed words if you forget them.

Not perhaps a game that will appeal to everyone, but if you like doing word puzzles, this program should be of interest to you.

The only way of classifying the next game is to call it a sort of strategy/simulation, for *UXB* from Virgin Games is a very original idea. Essentially, the idea is to defuse an old wartime bomb. There is a choice of six tools from 12 to take along, these include hammer, spanners, pliers, screwdrivers etc. The game consists of a number of set stages, most involving choosing which action to do next with what tools. Making one wrong move causes the bomb to explode. A nice feature of the game is that if you do get killed, you can restart the game from that point.

High resolution colour graphics are used to display the bomb and its circuits from all angles as the game progresses. Graphics also form part of the action in two sections of the defusing cycle, together with the arrow keys to move detonator out.

Typing *Help* will sometimes give you a clue as to what to do next and *Tools* will list what you have with you. The game is written in Basic with some machine code routines from various magazines (including *PCW*) for handling the text, sound and autorunning the program.

Mastering the game is really a matter of patience, trial and error. Of course, once you have found the correct method of defusing the bomb (which took me about two hours to find) the game loses all of its appeal as there is no random element in the program.

Unfortunately, there are a number of bugs in the program. For example, if one chooses to use the same tool twice, the program counts it as two tools. The restart option doesn't always work correctly, there is a simple way to cheat on the first graphic section and on the minefield you can walk straight through mines. Finally, as the program uses nearly all the memory, it occasionally crashes with an *Out of Memory* error.

With this number of bugs you will probably not be too keen on *UXB*, but don't be put off. The program makes a refreshingly original change from run-of-the-mill adventures or arcade games, and a 32K program with good graphics and sound for £7 is worth a second look at least.

Finally, in this review, are two games from Softek. *Monsters* is yet another version of *Space Panic*, also available on the Dragon in versions called *Bonka* and *Cuthbert goes Digging*. In case you aren't familiar with this game, it involves guiding a small figure up and down ladders, bashing holes in the floor for the baddies to fall through before they get you. Also, you are running out of air all the time. In this version of the game, you do not need to bash the robot on the head to make him fall, as in the original arcade game.

Monsters is a good version of this classic game, which uses the keyboard only, as does *Bonka*, and is similarly priced to the other versions mentioned.

So, it is really a matter of taste and whether or not you want to use joysticks, as to which you choose.

As has become traditional, I have left by far the best game until last. *Ugh*, also from Softek, is certainly one of the best arcade games to be released for the Dragon.

Ugh is a caveman, whom you control via joystick or keyboard, who knows that with the coming of the ice age he must stock his cave with food. Stealing eggs from the pterodactyl's nest at the top of the mountain seemed a good idea, until ptery arrives dropping boulders on poor *Ugh*. To top it all, along plods Rex, a giant tyrannosaurus to aid ptery by chasing and jumping on *Ugh*.

Armed with only a spear, which *Ugh* drops when he gets a egg, he must climb the mountain to the nest, get an egg and get it back to his cave, avoiding ptery and Rex, and if possible killing them for bonus points.

A bonus *Ugh* is awarded for every 5,000 points on the first screen and every 10,000 on the screen. At 10,000 points you move on to the next screen, which is a harder route up the mountain. Each screen contains 16 integral skill levels. A demo game is available on loading to give you the idea and show you all three screens.

The graphics in this game, which are in mode 3, show just what can be done with a lot of effort by the programmer and the animation is rivalled by no other game that I've seen. The sound is also a string part of this piece of software. For originality and graphics, *Ugh* surely beats Microdeal's *The King*, but lacks as many different screens. At £7, this is the best game for the Dragon in a long time and with the option of joystick or keyboard, and the ability to be easily transferred to disc, it is a must for every user's game collection.

Looking at this batch of software, it is evident that the general standards are still rising, slowly but surely. It is particularly good to see Dragon Data making an effort to get in on the software market once again.

48K SPECTRUM

VALHALLA

VALHALLA is supplied on a 48K Spectrum program cassette, with VALHALLA player manual and presentation box. As VALHALLA uses the full 48K RAM, microdrives and full-size printers are not supported. ZX printer optional.

VALHALLA is normally available from stock, and orders are despatched by return. If, for any reason we are unable to fulfil your order within 14 days of receipt, we will notify you.

VALHALLA cassettes carry an unconditional lifetime replacement guarantee.

TO ORDER: (UK Orders Only) Simply complete the coupon, and FREEPOST with your cheque/P.O. made payable to LEGEND (UK Mail Order).

Credit Card Orders: By phone 9-5.30 Mon to Fri, stating name and address, Card No. and item(s) required.

RETAILERS: Please contact your regular distributor or LEGEND (Trade Distribution) at the address below.

Search and find

Ron Luxton demonstrates how to store and list recorded programs

After the honeymoon period with my ZX81, I quickly found that I needed an orderly way of listing my increasing number of recorded programs, or I would have to spend hours searching through a motley collection of tapes each time I needed one.

The answer for me has been to use one side of a C10 or C12 cassette for each program, recording each one two or three times, and to store the tapes in the special stackable drawer units made for the purpose. These are often advertised at reasonable prices and can be added to as required.

Another way is to store programs on longer tapes — C60 or C90 — recording each program two or three times in succession. This is cheaper, but does require a recorder with a tape counter to make searching along the tapes a practical

proposition.

Program List for the ZX81 (16K) is designed for use with either method of storage and provides an opportunity to search for your programs either by number or by name. It has the added facility of obtaining a print-out, via the ZX printer, of a complete list in either numerical or alphabetical order should you require one.

It will allow you to list and search for your programs under three main headings, 'Games, Utility, and Programming, and a "Special Instructions" entry to enable a single character code to be entered against programs for whatever purpose you want — to identify those programs in machine code, confidential files, or perhaps merely to identify your favourites.

Program List A is intended for users of single tapes for each program, while Pro-

gram List B is for use where many programs are recorded, one after another, on longer tapes. The second program is a list of the line changes to convert Program List A to Program List B.

Program List B additionally allows entries for the number of each tape and the position on the tape of each program. It will search for and list these numbers, and both programs will list all entries with the same name, such as *Bank Account*, but will separately identify *Bank Account 1* from the rest if this is called for.

The program in Basic makes plentiful use of *Inkey\$* for rapid access and only the alphabetical order call, which puts the entries through a sort, takes any appreciable time. To limit this to 60 seconds or so, it will search through only the first three letters and three digits of the number of each line (line 1300). This may mean that *Analysis* appears above *Anagram* for example, but is a small price to pay for a rapid sort. Some of the multiple instructions lines are long — lines 580, 630 and 1090 — and care should be taken to enter

```

```

them exactly as written.

Before typing out the program, decide how many titles you will finally want to store as this cannot be altered later, although the full number of entries does not have to be entered at once and you can add to the list at any time. About 150 titles should fit comfortably within 16K. More may be squeezed in, but the alphabetical sort soon runs out of memory beyond this number.

Line 60 should read: "Dim A\$(number

of entries, 32)" and lines 95 and 483 should read: "IF A + (number of entries) Then Goto 635".

When the program has been entered, debugged and runs satisfactorily, Save it against accidental crashes, enter Run, and follow the instructions.

The program complete with your lists can be Saved and will automatically go to the menu on loading. Remember, however, that Run or Clear must not be used from now on or all the entries will be lost. If

you need to restart the program, enter Goto 530.

If you need to change any of the entries later without affecting the rest of the list, you should enter as a direct command, the following: "LET A\$(number of entry to be changed) = new program name, full stops, numbers, letter, code" etc, with the spacing exactly as lines appear in the rest of the program, press Newline, and the new line will replace the old. If you get the spacing wrong, then just try it again. ■

TURN YOUR PROGRAMME UPSIDE DOWN

Now you can add another dimension to your games.
Swap direction, swap functions, confuse your friends.
In fact you can add almost any twist to your games with
Stonechip's Programmable Joystick Interface.

You can also listen to them
with Stonechip's Echo Amplifier.

Programmable Joystick Interface. This also enables any Spectrum software to be used with a joystick, irrespective of which keyboard keys have been chosen for function.

Programming is easy using only a single switch. Switch one way to program and another way to play. No tapes to load or links to worry about — all programming is achieved by hardware. Used with Atari-compatible joysticks. Simply plugs into rear expansion port of ZX-Spectrum. No other connections to make, no additional power supply required.

Echo Amplifier. How would you like to listen to the sound output from your ZX-Spectrum without ear strain? The Stonechip Echo amplifier can do this for you as well as easing the tedium of saving or loading of tapes and enlarging the range of tape recorder compatibility with the computer. The amplifier has volume control over a range adequate for most uses, and a tone control for harsh or mellow sounds. A switched interface removes the need to swap leads during 'SAVE'ing or 'LOAD'ing. Leads are left connected all the time and the desired function is selected on the three position switch by the user. Use of the 'CUE' facility enables an audio cue to precede the program being 'SAVE'd' on tape, a decided advantage when searching through a multi-program tape. The Echo simply plugs into the Ear, Mic and Power sockets of the computer and does not require an additional power supply. The expansion port at the rear of the computer is left free for use with other peripherals and the unit is housed in an attractive case custom designed to complement the ZX-Spectrum.

Addressed and labelled

John Bradshaw presents a word-processing program for editing and printing letters and articles

I have found this program very useful for entering, editing and printing letters, notes for lectures, orders of church worship and sermon outlines. At the time when *WP* was written my only printer was the ZX: hence the number 32 (ie, the number of characters per line permitted by the printer) will be found in the program. I imagine that if 32 were replaced by 65 or 80, the program could be used by the better printer.

Text is inserted in the form of Data blocks at the end of the program. Since each block is accessible (by Listing) and cannot be affected by alterations to other blocks, editing and manipulation of the blocks is simple and safe! Hence, it is possible to delete, alter, expand and move blocks freely.

However, the price to be paid for entering text as Data is that the Spectrum will accept only about 450 characters per Data entry. So a paragraph on the ZX printer is limited to about 15 lines. On the other hand it is possible to do some things that are not possible even on some expensive machine-code, disk-based systems. For example, if the names and addresses to which a circular letter is to be sent are kept on tape as little blocks of data (ie, as 'mini-programs' within a reserved set of line numbers), each destination can be Merged with (*WP* + the letter), and the program will then print out a correctly addressed letter.

Moreover, since, as will be seen later, any data items can be selected for printing

on their own, having inserted the address on the letter, an 'address label' can then be printed for the envelope before proceeding to the next destinee.

The normal mode for entering text is one that uses 'word-wrap' and right-justification. This is the default mode — ie, unless the user gives other instructions, *WP* will print proportionately-spaced, justified block of text. A data entry which consists of # followed by a space will be printed without proportional spacing. An entry which begins with @ followed by a space is printed at Tab @, and an entry beginning with c followed by a space will be centred.

The main sections of the program are prefaced by REM statements, to which the following notes refer:

Advice

When Run is Entered advice is given on the screen on how to enter text at Line 2000 ff. This is followed by examples.

Main Menu

The user chooses the TAB value, single or double spacing, and whether to View or Print. Additionally, the user may select up to 26 blocks of data to be printed in any order. The user can also instruct the computer to number the blocks on the screen or on the print-out.

Proportional Spacing

Paragraphs are scanned line-by-line. The ends of words are tagged and spaces are inserted after them, progressively, until a line of 32 'characters' is formed. This line is then printed. A limiting device ensures that two or three words are not unduly expanded to fill the line. The Subroutine (Lines 1230 to 1410) is slow, so that lines with proportional spacing are printed at about one per second. Clearly this is where machine-code would help. On the other hand, the fact that the whole program is in Basic enables the user to adapt it according to his or her need.

Menu

When the text has been viewed or printed, the variables are saved and the user can make alterations; eg, from single to double-line spacing, etc.

I shall be happy to answer questions about *WP* or to provide copies of it on tape at £2 including postage: any proceeds will go to charity. Write to me at 2 Netherwood Close, Solihull, W. Midlands.

I usually Merge *WP* with my program *Relist* which renumbers the text (ie, the Data blocks) in tens and/or my program *Delete* which deletes *WP* itself, leaving only the text to be Saved. I shall be glad to know how to improve *WP*, especially by using machine code for Lines 1320 to 1410. I forgot to say that one edits in exactly the same way as when writing programs. ■

Someone is about to press the button for

Apocalypse

A GAME OF STRATEGY

"REDSHIFT HAS MADE THE WORLD OF WAR GAMES ORIENTATED COMPUTER GAMES ITS OWN"
P.C.W. - 24/30 NOV 83
ISSUE

The leading game (APOCALYPSE) has four different maps, on any one of which you may fight your war (see section A.). An additional tape which contains a further six maps may also be added to expand your atlas (see section B.). Alternatively, you can be NERO in the FALL OF ROME or Napoleon's right-hand man in NAPOLEON'S CAMPAIGN in 1813 (see section C.). Can you survive the War of 1984 or could you lead your marines from island to island in the PACIFIC war? (see section D.).

New from **SUNSHINE** Master your ZX Microdrive

programs, machine code and
networking by Andrew Pennell

Master your ZX Microdrive contains all
the information you will ever need to use
the ZX Microdrive to the full. Clearly
explained, with many examples, it is
equally suitable for the relative newcomer
to BASIC through to the experienced
machine code programmer.

Andrew Pennell has also included a full database file handling
program to let you put the ZX Microdrive to practical use
with your Sinclair Spectrum.

Look out for the Sunshine range in W.H. Smith's, Boots, John Menzies,
other leading retail chains and through our national network of book
shops and specialist stores. Dealer Enquiries: 01-437 4343

ISBN 0 946408 19 X

Please send me

☐ Master your ZX Microdrive at £6.95 each

I enclose cheque/postal order for £_____ made payable to:
Sunshine Books: 12/13 Little Newport St., London WC2 3LD.
Or phone your order through on Access Mastercard 01-437 4343

WIN THE POOLS?

**SPECTADRAW 2 — THE MOST POPULAR
POOLS PREDICTION PROGRAM OF 1983
NOW EVEN BETTER VALUE IN 1984!!!!**

- ★ Supplied with a database tape containing data on over 8,000 matches since 1980.
- ★ Database is updated each week by user.
- ★ Match and Division names already in the program — no tedious typing every week!
- ★ Program is menu driven for simplicity of use.
- ★ Errors can easily be corrected — the program even checks your entries!
- ★ Comprehensive instruction manual designed to make the program easy to understand.
- ★ Will also forecast the least likely draws for those who prefer to bet on fixed odds.
- ★ Supplied together with SPECTASORT — the Perm Generation Program which takes SPECTADRAW 2's predictions and turns them into ten 8 from 10 full cover perms. Complete your coupon direct from the screen!!

SPECTADRAW 2, 8,000 MATCH DATABASE, SPECTASORT AND INSTRUCTION MANUAL. THE COMPLETE POOLS PREDICTION PACKAGE FOR THE 48K SPECTRUM — NOW AT THE UNBEATABLE PRICE OF £9.95 INCLUSIVE. (Cheques/POs payable to B. S. McAlley).

SPECTADRAW, 1 COWLEAZE, CHINNOR, OXFORD OX9 4TD

METAGALACTIC LLAMAS BATTLE AT THE EDGE OF TIME

A fast and original game for the unexpanded VIC. Challenging and colourful, with good sound and a unique game action and design, this promises to be the most exciting new 3.5K VIC game since the introduction of GRIDRUNNER nearly a year ago. £5.50

LASER ZONE

Experience Laser Zone – an utterly NEW totally ORIGINAL masterpiece of Video games design. Learn to control two spaceships at once. Feel the EXHILARATION as, after long hours of practice, you control the two ships so that they function as a smooth, co-operative team! Feel the raw POWER as you lunge for the electro button and BLAST your enemies into expanding clouds of SPACE JUNK!! Feel the humiliation as a carelessly aimed BLAST slams into the side of your last remaining ship!! 8K expansion required.

Available for Commodore 64 £7.50 and VIC-20 £6.

MATRIX

Jeff Minter has taken Gridrunner – the game that topped bestseller charts in USA and UK – and created an awesome sequel. Graphically superb, it features multiple screens, new aliens and attack waves, mystery bonuses, renegade humanoids, deflexor fields, diagonal tracking, countdown/panic phase and much, much more...

Packed into 20 mind-zapping zones and accompanied by incredible sound effects. 8K expansion required.

Available for Commodore 64 £7.50 and VIC-20 £6.

ATTACK of the MUTANT CAMELS

Planet earth needs you! Hostile aliens have used genetic engineering to mutate camels from normally harmless beasts into 90 foot high, neutronium shielded, laser-spitting death camels!! Can you fly your tiny, manoeuvrable fighter over the mountainous landscape to weaken and destroy the camels before they invade the human stronghold? You must withstand withering laser fire and alien UFOs. Game action stretches over 10 screen lengths and features superb scrolling, scanner 1/2 player actions and unbelievable animation! Play this game and you'll never be able to visit a zoo again without getting an itchy trigger finger! Awesome m/c action!

Available for Commodore 64 £7.50.

HOVER BOVVER

A totally original arcade game for C64 featuring outstanding graphics and a sound track created by a professional Piano Wizard. Gordon Bennet has borrowed his neighbour's Air-Mo lawnmower. Mow your way through as many of the 16 lawns as you can before the pursuing neighbour retrieves his mower. Set your dog onto the neighbour to help you out of tight spots and don't annoy the gardener. Try not to plough through the neat flower beds or overheat your mower!

£7.50

ABDUCTOR

A classic new space game! ZAP the swirling alien hordes before they ram you – and abduct your humanoids! Survive the assault for long enough and you'll get an extra stage on your spaceship with double firepower! Awesome unexpanded VIC Action. £5.00

GRIDRUNNER

Finally true arcade quality on the unexpanded VIC! Shoot down the segmented DROIDS invading the grid. Beware of the pods and zappers! The awesome speed, sound, and graphics gives you the best blast available for unexpanded VIC. Available for VIC-20 £5.00 Commodore 64 £5.00 Atari 400/800 £7.50

All orders add 50p postage and packing

REVENGE

OF THE MUTANT CAMELS

At last the long awaited sequel to Attack of the Mutant Camels is available. You are controlling a ninety foot high, neutronium shielded, lazer spitting death camel; leading a rebellion against your evil Zzyaxian overlords. The game features beautiful smooth scrolling graphics and no less than 42 different attack waves, more than any game in video history. The challenge of play will last for months as you battle to see what's on the next wave. £7.50

Curved slope

Milosć Versipellis presents an envelope shaping program for the Commodore 64

This program for the Commodore 64 allows the user to explore the SID chip's envelope shaping capability. It is written *top-down* style to isolate sub-routines for use in other programs. The many lines with just a colon are to add readability, they are not necessary to the

working of the program.

Four variables define the shape of the program by setting the *slope* of a curve. The numbers are coded logarithmically, so that a slope of two is twice a slope of one. This is necessary since human senses measure all input logarithmically. Since it

is the slope that is being set in coded form, a zero will still produce a slope.

As a clue to your experiments, the coded numbers 0 to 15 can be thought of as the length of time a particular phase lasts, so that you can hear the envelope effects. Perhaps you would like to try the following — they are given in order — Attack, Decay, Sustain, Release:

10, 10, 10, 0	HARPlike sound
10, 15, 0, 0	HARPSICHORDlike sound
15, 0, 10, 15	A Great AMEN
12, 2, 13, 9	A lesser Amen
12, 7, 7, 10	Typical envelope natural
8, 4, 2, 1	BANJOLike sound

New-Sinclair QL

There's no comparison chart, b

The Sinclair QL is a new computer.

Not just a new Sinclair computer, but a totally new sort of computer – nothing like it exists anywhere.

It's not just a bit better than this, or a bit cheaper than that – it's a computer that's very hard to compare with anything. Just check the features below – and if you don't agree, take up the challenge at the end of the advertisement.

If you do agree, there's only one course of action you can take... get yourself a Sinclair QL at the earliest possible moment.

The Sinclair QL has 128K RAM. Big deal?

Several micros offer 128K RAM, or more, as standard. The 'What Micro?' table for December 1983 lists over 50 of them – but 40 of the 50 micros listed cost over £2,500!

The Sinclair QL offers you 128K RAM for under £400, and an option to expand to 640K. That's a lot of bytes to the pound!

The Sinclair QL has a 32-bit processor. Who else?

Under £2,700, nobody. Even the new generation of business computers, such as the IBM PC, are only now beginning to use 16-bit processors.

At prices like this, the Motorola 68000 family – widely regarded as the most powerful microprocessors available – will remain a luxury.

Yet with the Sinclair QL, the 32-bit Motorola 68008 is available for less than £400.

You can also be sure that the QL will not become outdated. 32-bit architecture is future-proof.

32-bit processor architecture, 128K RAM, and QDOS combine to give the QL the performance of a mini-computer for the price of a micro.

Exclusive: new QDOS operating system

No competition! QDOS sets a new standard in operating systems for the 68000 family of processors, and may well become the industry standard.

QDOS is a single-user, multi-tasking, time-sliced system using Sinclair's new SuperBASIC as a command language.

One of its most significant features is its very powerful multi-tasking capability – the ability to run several programs individually and simultaneously. It can also display the results simultaneously in different portions of the screen. These are features not normally available on computers costing less than £7,000.

Eleven input/output ports

QL ROM Cartridge slot

2x Joystick ports

2x RS-232-C

New professional keyboard

The QL keyboard is designed for fast input of data and programs.

It is a full-size QWERTY keyboard, with 65 keys, including a space bar; left and right-hand shift keys; five function keys; and four separate cursor-control keys – key action is positive and precise.

A membrane beneath the keyboard protects the machine from dust (and coffee!), and for users who find an angled keyboard more comfortable, the computer can be raised slightly at the back by small detachable feet.

£399

because there's no comparison!

Advanced new friendly language – Sinclair SuperBASIC

The new Sinclair SuperBASIC combines the familiarity of BASIC with a number of major developments which allow the QL's full power to be exploited.

Unlike conventional BASIC, its procedure facility allows code to be written in clearly-defined blocks; extendability allows new procedures to be added which will work in exactly the same way as the command procedures built into the ROM; and its constant execution speed means that SuperBASIC does not get slower as programs get larger.

Included – superb professional software

The suite of four programs is written by Psion specially for the QL and incorporates many major developments. All programs use full colour, and data is transportable from one to another. (For example, figures can be transferred from spreadsheet to graphics for an instant visual presentation.)

Word-processing

Certain to set a new standard of excellence, QL Quill uses the power of the QL to show on the screen exactly what you key in, and to print out exactly what you see on the screen.

A beginner can be using QL Quill for word-processing within minutes.

QL Quill brings you all the facilities of a very advanced word-processing package.

Business graphics

QL Easel is a high-resolution colour program so easy to use you probably won't refer to the manual! It handles anything from lines, shaded curves or histograms to overlapping or stacked bars or pie charts. QL Easel does not require you to format your display before entering data; it handles design and scaling automatically or under your control. Text can be added and altered as simply as data.

Spreadsheet

QL Abacus makes simultaneous calculations and 'what if' model-construction easier than they've ever been. Sample applications are provided, including budget-planning and cash-flow analysis. QL Abacus allows you to refer to rows, columns and cells by names, not just letters and numbers. Function keys can be assigned to change a variable and carry out a complete 'what if' calculation with a single key-stroke.

Database management

QL Archive is a very powerful filing system which sets new standards, using a language even simpler than BASIC. It combines ease of use for simple applications – such as card indices – with huge power as a multi-file data processor.

An easy-to-use labelling facility means that you don't have to ask for your file by its full name – a few letters are enough.

New – the Sinclair QUB

The QUB is the QL Users Bureau. Membership is open to all QL owners. For an annual subscription of £35, QUB members receive one free update to each of the four programs supplied with the QL, and six bi-monthly newsletters. Sinclair has also made exclusive arrangements for QUB members to obtain software assistance on QL Quill, Abacus, Archive or Easel by writing to Psion.

The Sinclair QL challenge

If you're seriously considering any other computer, post the coupon for a blow-by-blow comparison. We'll take a published comparison chart for the machine you're considering (not one we've created ourselves) and give you the Sinclair QL figures, detail by detail.

Take action today!

To order by mail

– complete the coupon and send it to the FREEPOST address below. For credit card holders it may be possible to extend your credit limit. Full details will be sent when we acknowledge your order.

To order by telephone

– phone Camberley (0276) 685311; – have your credit card (Access, Barclaycard, Trustcard) number ready. It may be possible to extend your existing credit limit. Please ask our telephone staff for more details. **Please do not use this number for other enquiries.**

For more information

Phone Camberley (0276) 686100, or use the coupon to get a QL brochure.

Please allow 28 days from receipt of order. Remember that Sinclair offers a 14-day money-back undertaking.

TM Sinclair, QL, QDOS, QUB and ZX Microdrive are trade marks of Sinclair Research Ltd.

Two 100K microdrives built in

The Microdrives for the Sinclair QL are identical in principle to the popular and proven ZX Microdrives, but give increased capacity (at least 100K bytes each) and a faster data-transfer rate. Typical access speed is 3.5 seconds, and loading is at up to 15K bytes per second. The Sinclair QL has two built-in Microdrives. If required, a further six units can be connected.

Four blank cartridges are supplied with the machine.

Send to: Sinclair Research Ltd, Computer Division, FREEPOST Camberley, Surrey, GU15 3BR.

Access to files

Brian Cadge looks at direct access on disc drives in the first of a two-part series

Now that the Dragon disc drives are finally available in quantity, more and more users who have paid out nearly £300 for this metal box will be asking themselves "Is it just a fast cassette recorder?" Although one of the main advantages of a disc drive is its speed, the other major benefit is not so immediately obvious — the capability for sophisticated file handling.

Cassette tapes have the disadvantage of being serial access only — that is, record 2 can only be read after record 1 and so on. But a disc drive is capable of 'random access', that is, reading any record you wish at 'random'. The file handling commands added with the DDS cartridge are easy to use and lend themselves to direct access filing, although there is no provision for true random access from Basic as on some other drives.

The program presented here illustrates the use of direct access files and should be of use to any disc drive owners who want to keep names and addresses or catalogue their programs, etc. To try and make

it as easy to follow as possible, the program is designed as a series of modules — easily spotted by the Rem lines. Line 60 defines the important function which will simulate direct access files. The Dragon disc drives allow a file to be created as it is written to, but this is only suitable for serial data. For our purposes, the disc space must already have been reserved for the file in advance — similar to a Dim statement — and this is done by the first module. Notice in line 310 that by the use of the Free function it is possible to avoid a possible error by checking that the disc space exists before attempting to Create the file in line 330.

To read an entry from the file, the user-defined function is used, with the argument being the record number that we wish to read. The length of the record, L, must also be stated as well as the name of the file, F\$, see line 510. This program also allows you to enter a 'search string', the program then searches through the whole file and prints any possible match that it finds — the Instr function is very

useful here.

Not only can we read from any record directly, we can also, of course, write to any record and this is done by the module starting at line 800. The same format is used for the Fwrite command in line 880 as is used for the Fread command.

Another very useful feature of the DOS Basic is error trapping. The program is fully error trapped. Any errors not found by the individual modules are handled by the error routine starting at line 1010 — the Error Goto command in line 70 points to this. The most common errors, for example caused by the user not inserting a disc properly, are explained in full. Others have their code number and line number displayed. After an error has occurred, control is passed back to the main menu.

By not having any data in Ram, except when required, the files can be as big as disc space will allow, up to 165K. This program is only an example of file handling on the Dragon, it is written in such a way as to be easily expanded. I leave it up to you to customise it and add your own modules as you like; for example, a printer dump of the files contents.

Next week, we take a more technical look at Dragon's disc drives, including a memory map for the DOS and some DOS Rom routines of interest to the machine code programmer.

Keyed up

Michael Durrant explains how to get 40 function keys on the BBC with 1.2 Rom

This program enables you to set up the function keys on the BBC B such that you can get not the usual 10 but 40 different functions.

1.2 Rom (and so will not work on machines with the old Rom) and using function keys in conjunction with different keys. The combinations are as follows:

- 1) Function keys on their own
- 2) Function keys with Shift

- 3) Function keys with Control
- 4) Function keys with Control and Shift

The important thing to note is that the additional 30 character definitions will survive not only a Break but also a hard — reset (Ctrl—Break). This means that once this program has been run and the characters defined, another program can be entered (in Mode 4 say) and the keys can be used to insert the definitions as one character, instead of the Print Chr\$ (224); etc, with the Vdu definitions at the beginning.

This facility is made possible by the new

OPEN FORUM

Open Forum is for you to publish your programs and ideas. Take care that the listings you send in are all bug-free. Your documentation should start with a general description of the program and what it does and then give some detail of how the program is constructed. We will pay the *Program of the Week* double our new fee of £6 for each program published.

Maze 'n' Chase

on Spectrum

Maze 'n' Chase is an addictive maze chase-type program with a difference. You are the small man beginning at the bottom of the screen. You must move around the maze, eating the dots and scoring points (use cursor control keys to move, arrows

show direction of movement). However, you must avoid the small invader that inhabits the maze, who moves towards you with deadly intent. Every spade you run into enables you to dig one hole in the maze (press key 0 to dig). Only the invader can fall down the holes you dig, and when he does you must race to the scene and fill in the hole (press key P to fill); this must be done before the invader has time to climb out.

Whenever an invader is buried, you will have several seconds before a new and identical invader appears. There are four spades in each maze. When you have cleared the maze of dots and spades, you will move on to a new and different maze. You have four lives. You score one point for each dot eaten, 10 points each spade picked up and 30 points for each invader buried.

Program notes

The program uses the *Attr* and *Screen\$* function extensively throughout to detect what is where in the maze. The main purpose of lines 104-240 is to control the movement of the invader. The invader will keep within the maze walls and will actually chase you. If the invader gets near you he will accelerate. User-defined graphics are used and are set up in lines 1000-1020. The maze is constructed in lines 5-50.

Maze 'n' Chase
by James Southgate

OPEN FORUM

Music

on BBC

This machine code routine makes keying in programs more pleasant, giving you a beep of varying pitch each time you press a key.

The *Osrdrch* vector is altered to point to this routine. At the end of the routine a jump is made to &DFA5, which is the normal contents of the vector at &210.

The pitch of the note is determined by multiplying the ASCII code of the letter you press by three. An *Osword* routine is used to make the sound.

Instructions on how to change the various parameters of the sound are given in the program. Lines 310-340 determine whether the code is less than 32; ie, a control code. If it is a control code then a sound is not emitted. Lines 460-500 are responsible for making the sound.

SPRITES FOR THE DRAGON

Merlin's Sprite Magic offers a whole host of new features for the Dragon

Up to 128 sprites. Size up to 40 x 40 in mode 4, even larger in other modes. Sprite magic uses the 256 x 192 grid for screen addressing. Sprites are programmable for joystick control and/or keyboard control. Sprites may be defined as missiles fired from other sprites in response to fire-button or keyboard. Sprites may be programmed to rebound (like a bouncing ball), or wrap round, or disappear automatically when they get to the edge of the (user defined) screen. A wide range of commands and functions offers comprehensive control of speed, direction, screen edge behaviour and collision detection.

Animation is easily implemented with DRWG function which swaps the drawings being used for sprites and they needn't even be the same size.

Some of the commands are exceptionally powerful... MOVEn moves a single sprite, MOVEn,n moves a block of sprites, MOVEM moves all the sprites. All the MOVE commands observe the individual direction, screen-edge, joystick and keyboard instructions for the various sprites. The REPORT function reports how many have crashed. The HIT function reports crashed sprite numbers.

Sprites are non-destructive i.e. they do not leave a "trail". They're fast and they're efficient and they're easy to use.

The Dragon now has its very own BEEP command. This one, however, offers a range of 16 pre-programmed gunshots, explosions, sirens, laser sounds and the like. You can also program your own... BEEP (six parameters) lets you generate the kind of noises you have heard on other high quality software.

Keyboard handling has had some attention too... optional auto-repeat, INKEY function returns ASCII code, KEY function does the same, but waits for a keypress. CLEAR key clears hi-res screen and homes the print cursor.

We have also included a couple of routines to provide text on the hi-res screen... in all 5 PMODES with enhanced cursor controls providing relative as well as absolute positioning, PAGE command, HOLD command (to fix headers or graphics), COLOUR command changes text foreground and background colours etc. The hi-res screen is used just like the Basic text screen, including editing. You can also re-define the character set using the friendly new command CHR(n)=eight row values.

Sprite Magic requires absolutely no knowledge of machine code. The comprehensive manual describes the new Basic commands in full, with lots of examples. As well as the documented demonstration program, the cassette includes Character and Sound Generators, Mate in two (yes you can!), Shooting Gallery and Breakout. Price £17.25 all inclusive.

Letter Puzzle

on Vic20

This program draws a five by five grid with the letters a to x. You then move the letters

and try to get them into order. The instructions tell you the order in detail. You move the letters with the keys:

W = Up
A = Left
D = Right
X = Down

— or use a joystick. The puzzle is like *Magic Squares* which are small plastic squares in which you move bits around to make words or pictures. The Rem statements are self-explanatory and so you should be able to follow how the program works easily.

GEM SOFTWARE NEW RELEASES

OH MUMMY!!

Your party of archaeologists enter the pyramid in search of the mummies of the pharaoh's household. There are five burial chambers containing treasure, secret scrolls, keys, royal mummies and some nasty surprises. To pass from one chamber to the next, you must find the key and royal mummy, but beware, you may uncover a guardian, who will chase your group to avenge your desecration!! A Machine Code game for those with nerves of steel and great courage.

Price (LYNX) £7.95
Price (ZX81 & SPECTRUM) £4.95

TANK ATTACK**

A machine code game for 1-2 players, defending supplies against computer controlled tanks. This game will stretch your reflexes to the limit as you battle with the enemy tanks. They won't be able to shoot back until they have supplies, but when they do, look out! Joysticks required.

Price (BBC-B OS 1.0+) £7.95

SUB CHASE

A great machine code game in which you must depth charge the submarines. Sounds easy, but you must position your destroyer, set detonation depth, fire and hope you can evade the sub's missiles. The problem is, the higher the skill level, the more intelligent the subs become, and you only have a limited supply of depth charges!!

Price (SPECTRUM) £4.95

UTIL 1

Two very useful programs for your BBC-B. Both tested on OS 1.0 and above. *Character Define* gives you a very comprehensive and simple way to quickly create all manner of user-defined characters. *Envelope Editor* will enable you to unravel the complexities of the Sound and Envelope commands, so that you can produce exactly the sound you require.

Price (BBC-B OS 1.0+) £9.95

**THESE PROGRAMS ARE AVAILABLE FROM LARGER BRANCHES OF *Booth*

All prices include postage and packing. All cassettes despatched within 48 hours of receipt of order. Access orders welcome.

Input

on Spectrum

The purpose of this piece is to provide an alternative to using the *Input* statement when entering numerical data into Spectrum. The *Input* statement has three major faults: first, the value entered is removed from the screen once the *Enter* key has been hit. The second is that using *Input* stops you from using the bottom two lines of the screen for display purposes. Third, and most importantly, *Input* is not 'user friendly' for numeric data. If we hit a non-numeric key by accident (and we all

do this from time to time), then the program will crash with an error code 2.

Program 1, which uses *Inkey\$* instead of *Input*, has been written as a subroutine which can be used with other programs. An input prompt is printed (line 3010) and the auto repeat is cancelled (line 3020). The subroutine now waits for a key to be hit and the result is stored in location B\$. Lines 3050 to 3100 test the *Code* of the last key hit to ascertain whether or not that key is valid for numeric data.

Program 2 is an illustration of a main program using this subroutine, the data that we enter being stored in an array X. As the subroutine stores the numeric data

as a string, we must use the *Val* function if we wish to use X as our array.

Also it is convenient to initiate an auto-scroll (lines 60 and 160) in case we wish to store more than 20 numbers. The *Print* statement following the *Gosubs* are necessary because the subroutine does not force the computer to move to the next line. Program 3 illustrates how the subroutine can be used when entering pairs of numbers — in a regression program, for example. I have found this subroutine to be especially useful when I have written programs where the output is in the form of a table, but one entry per line of the table is an input.

Program 1

Tread The Path of Adventure with GILSOFT

FOR THE 48K SPECTRUM

MAGIC CASTLE £5.95

Try to rescue the princess from the castle, but beware of booby traps and vampires! A gripping adventure for the 48K Spectrum.

THE QUILL

£14.95

THE QUILL is a major new utility written in machine code which allows even the novice programmer to produce high-speed machine code adventures of superior quality to many available at the moment without any knowledge of machine code whatsoever. Using a menu selection system you may create well over 200 locations, describe them and connect routes between them. You may then fill them with objects and problems of your choice. Having tested your adventure you may alter and experiment with any section with the greatest of ease. A part formed adventure may be saved to tape for later completion. When you have done so **THE QUILL** will allow you to produce a copy of your adventure which will run independently of the main **QUILL** editor, so that you may give copies away to your friends.

THE QUILL is provided with a detailed tutorial manual which covers every aspect of its use in writing adventures. For the 48K Spectrum

DIAMOND TRAIL £5.95

RECOVER the Sinclive diamond after a daring robbery. First you must overcome many problems in a city fraught with danger and intrigue. This is our latest adventure for the 48K Spectrum.

TIMELINE & TASKS £5.95

A superb 16K adventure in which you must locate your time machine to return to the present. Plus a collection of mind stimulating puzzles.

Our Software is now available from many computer shops nationwide, or direct from us by post or telephone.

SAE for full details of our range.

Dealer enquires welcome.

Tony Bridge's Adventure Corner

Beginners only

What would you recommend as a good Adventure for a beginner to start on? This is a question that I am often asked and, to be truthful, I cannot answer it!

There are, nowadays, several categories of Adventure — we can distinguish text Adventures, text with graphics, and graphics-only Adventures. We can further reduce any Adventure to one of two types if we concentrate on playing techniques.

Programs like *The Hobbit* or *Valhalla*, and most of the D&D-type combat Adventures, actually change with each playing, and the solution to the game at one playing need not necessarily be the solution at the next playing. Having silly Thorin wandering about, wittering on about Gold, or Mary bashing you over the head when you let loose a perfectly reasonable bit of strong language may prove a bit confusing to the beginner, who has enough to worry about (although I recently had a letter from an Adventurer of eight years old who completed *The Hobbit* in just a week or so!).

So, although the unpredictable elements in this kind of Adventure may appeal to some players, in general, the beginner will find that text Adventurers are easier to play, with graphic Adventures being tackled later.

From America, Scott Adams and his company, Adventure International, have one of the most well-known catalogues of Adventures. These are available for all the American computers — Atari, Vic20, CBM 64, Apple — and have the added bonus of a Difficulty Rating system. Thus, *Pirate Adventure* is the easiest and would be a good place for the absolute beginner to start. The others range through Medium Difficulty to Advanced Adventurers Only Need Apply!

Probably the hardest is *Savage Island Part 2*, and I wouldn't recommend this one to a complete novice. Anyway, they're all pretty good value, and if you have an Atari or Apple, you can get to see a SAGA (Scott Adams Graphic Adventure) — they are rather expensive, and apart from the pretty pictures, are exactly the same as the text version.

The Scott Adams Adventures are now available for the Spectrum. Adventure International has finally woken up to the

fact that there are a million Sinclair owners, a large percentage of whom are just dying to get their hands on a Scott Adams Adventure — and none of them will be disappointed!

Of the other American text Adventures easily available over here, I must single out for mention the Infocom series. *Zork I, II* and *III* are the most famous, but the others, like *Suspended*, in which the player controls six robots which are his eyes, ears, and other senses, and *Witness* and *Deadline*, which contain complete dossiers of Police files, are equally as good. They're all very expensive — but they are state-of-the-art.

All this is pretty advanced stuff, however, and I only mention them as an example of what goodies you can look forward to!

Back on solid ground, and in the UK, we have many companies putting out Adventures which would make a good starting point for our budding Adventurer.

For the ZX81 and Spectrum, a good range of Adventures is available from Artic. There are four of them, with a fifth in preparation. With the exception, I believe, of the latter, they are all text (complete with the occasional odd spelling!). The scenarios and plots are excellent and invoke a good sense of atmosphere. But be warned — although they are a good introduction, they are not easy, and occasionally need rather lateral thinking (but that's what Adventuring is all about!).

Having been around for a number of years, they have obviously stood the test of time — three years is an eternity in the home computing market!

A large range of computers is catered for by Channel 8 Adventures. In the distant past, they were writing for the Nascom and Tandy TRS80, but in the last few months, the company has written versions of its 12 Adventures (and this number may increase by two or three in the next few weeks) for a much larger range of machines, which includes the BBC, Spectrum, Commodore and Atari computers.

The Adventures are text supported by nicely-drawn graphics, and the pictures, pretty though they are, can be toggled on or off as the player wishes. In fact, they have to be cleared from the screen if the player wishes to see what is at the current location.

They are all written by Brian Howarth, who obviously takes Scott Adams as a model, and his programs are a good training ground for the beginner.

Other worthwhile additions to the Spectrum owner's library are the Phipps Associates Adventures. Written by Mike Farley, they are, again, text Adventures, supported by graphics. Unfortunately, these are very slowly drawn, and the whole process can be very boring when repeated again and again. However, the Adventures themselves cannot be faulted, and *Knight's Quest* has become something of a classic Spectrum Adventure.

For the beginner, *Greedy Gulch* contains many of the common problems to be

found in Adventures, and is a good beginner's program.

The Spectrum, of course, is the machine with probably the biggest support from third-party software authors, and among their products are many good Adventures.

For the Dragon, Salamander has the Dan Diamond Trilogy. A pastiche of the Mike Hammer sort of detective novel, they follow the fortunes of the Private Eye from a graveyard in California in *Franklin's Tomb* to deep space in *Lost In Space*, to a watery alien world in *Fishy Business*. These Adventures are text only, although the beautifully produced accompanying manuals contain pictures of many of the locations, with clues embedded in them.

Pettigrew's Diary, from Shards Software, is a graphic Adventure, but suitable for beginners and certain to keep anyone hooked for many hours while travelling through the London Underground system among other locations.

Acornsoft, in their initial release of software for the BBC, included a couple of Adventures. *Castle Of Riddles* and *Philosopher's Quest* have been with us for a couple of years and still baffle people with dancing bears and rainbow-coloured rods. Third-party software is now coming through for the BBC machines.

For the Oric, you will find some good Adventures among the Tansoft catalogue — *Zodiac Adventure* being one of the better programs for beginners.

This list has been necessarily brief — in future weeks, I'll look at some in more detail, and add to the list. ■

This series of articles is designed for novice and experienced Adventurers alike. Each week Tony Bridge will be looking at different Adventures and advising you on some of the problems and pitfalls you can expect to encounter. So, if you have an Adventure you want reviewed, or if you are stuck in an Adventure and cannot progress any further, write to: Tony Bridge, Adventure Corner, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

DOES IT EXIST?

G Back of Bradbourne Road, St Johns, Sevenoaks, Kent, writes:

Q Do you know anything about the Rom cartridge slot on the BBC micro? I know that it costs £55 to install and you get a speech chip, but what about the cartridge for the slot? Do they exist? My dealer cannot help.

A In short, no! Now that the Electron has at last seen the light of day, the Rom cartridge slot remains the great mystery of Acorn Computing. As far as I know all you can get for the £55 is the speech chip with its 175 word vocabulary. Apart from that, to my knowledge, there are no cartridges available from Acorn or anyone else.

Perhaps one of the reasons for this is that Acorn have released no specifications for the cartridge, the handbook that comes when the cartridge is added, is, to say the least, sketchy. I doubt that cartridges will become available in the near future, especially as the Electron does not have the cartridge slot.

DISC TO CARTRIDGE

Dr Manfred Dechmann of Herrenbergstrasse 1, Zurich, writes:

Q How can I load programs on disc on to a cartridge or module. I need a few programs very often — five times a day — and so I want to save the loading time even from disc.

I have a C64 with 1541 disk station and Epsom RX80.

A If I understand your question correctly what you are asking is how to copy

disc programs to cartridge. The answer, I'm afraid, is with great difficulty. Unlike copying from tape to disc where the problems can be solved by playing around with the software memory locations, etc, a cartridge is a program "burnt into" an Eprom and mounted on a circuit board.

In some magazines from America I have seen devices that enable you to burn in your own Eproms, but they are very expensive. I doubt though this would solve your problem. If you are using the disc information daily for something like word processing or records, an Epsom has two major problems; firstly it cannot usually have programs longer than 32 K, sometimes 16K — probably not enough for your purposes — and, secondly, you cannot change the data information as with a disc — adding and erasing addresses, for example.

I'm afraid the only real way you have of speeding up access times is to see if your disc system cannot be improved in some way, but I doubt any difference would be very substantial.

ZX PRINTER

G. T. Swain of Fairmead Crescent, Edgware, Middlesex, writes:

Q I own a Sinclair ZX81 and I have a Spectrum on order. Can you recommend a printer that could be used with either machine. I already have a Sinclair printer, and to say the least it is not very good.

A Other than the Sinclair printer there are no printers that you can connect directly to your ZX81 or Spectrum (there is, though, a plain paper version of the Sinclair printer available that was originally designed for use with the Timex).

So any other printer you might choose will need to be interfaced. Almost all the available interfaces are Centronics, ie, they enable you to connect your Spectrum to Centronics printers — fortunately this is the vast majority. Suitable interfaces are made by Hilderbay, Kempston, Tasmann and Morex (among others) and with them you

should find that virtually any cheap printer can be connected.

As to what you should buy, it really is up to you. How much money do you want to spend? Is it mainly for letters or listings? If you don't want to spend more than £200 and only need it for listings, then any dot matrix printer will do — an Epsom, for example. If it's for important letters, then you may need a Daisywheel costing more like £350.

I doubt that any other than Spectrum interfaces will work with the ZX81 — you will probably have to buy a special one for it, although you should be able to use the same printer.

OVERHEATED VIC

Matthew Smith of Elan Avenue, Stourport-on-Severn, writes:

Q Not wishing to pay £200-plus for a Commodore printer, I was considering buying a smaller one. The one I have noticed is the Amber which is £70, but I would like to know if a dearer one would pay off?

The other problem that I have is overheating. After an hour my Vic gets very hot, and after about three hours it reduces my programs to gibberish. This means that I have to turn off and start again. I find that the slits at the back do little to help the problem. Is there a small cheap fan available that I could use to reduce the heat?

A People are always asking questions about printers — quite rightly since they can cost more than the computer itself. There are all sorts of problems with buying printers, but they are particularly highlighted with Commodore machines.

The problem is this — Commodore programs make much use of control characters — particularly for cursor move-

ment and colours, consequently listings are full of them. Since you were considering the Amber I would guess that your main requirement from a printer is to do program listings rather than word processing. The problem is that the Amber, and indeed all printers other than the Commodore ones, do not support the control characters. Thus, even assuming you manage to interface a printer to your Commodore so that it will print basic numbers and letters, it will still not print the control characters. I think you would be best advised to look for a second-hand Commodore printer — you should be able to find one for less than £200.

Your heat problem is very common and apart from taking care to save programs every couple of hours or so, there isn't much you can do. Commercial computers have inbuilt coolers, but it is hardly practical for you to open up your computer and put a fan in it.

LYNX USER GROUP

Ms G. Marsh of Kingston Road, Oxford, writes:

Q I have recently bought myself a 96K Lynx computer, and while I'm pleased with it, I also find that there is very little published for it. I suppose that's what happens if you get a computer that is not a big seller. What I would actually like to know, is there a Lynx User group?

A The Lynx as you rightly imply is overshadowed by the likes of the BBC at one end, and the Spectrum at the other. It is a pity because it is fundamentally a good computer. However, all is not lost as there is a Lynx User group, namely NILUG (National Independent Lynx User Group). The address you want is NILUG, 53 Kingswood Avenue, Sanderstead, South Croydon, Surrey CR2 9DQ.

Is there anything about your computer you don't understand, and which everyone else seems to take for granted? Whatever your problem Peek it to Ian Beardsmore and every week he will Poke back as many answers as he can. The address is Peek & Poke, PCW, 12-13 Little Newport Street, London WC2R 3LD.

MAGAZINES

DRAGON USER

To make the most of your Dragon you need **Dragon User** — the independent magazine for Dragon owners. To make sure that you receive a copy of Dragon User regularly subscribe direct to us. A year's subscription costs £8 for 12 issues or subscribe for two years for £14.40 and receive a free copy of either **The Working Dragon** or **Dragon Gamesmaster** (overseas rates available on application). Send a cheque or postal order made payable to Dragon User, and accompanied by your name and address, to Dragon User, Subscriptions Department, Oakfield House, Perrymount Road, Paywards Heath, Sussex RH16 3DH.

EDUCATIONAL SOFTWARE

DON'T WAIT until examination panic sets in. Consult London's foremost tutorial agency now. Almost all subjects at all levels. Tel: 01-722 1379.

EDUCATIONAL SOFTWARE for 48K Spectrum, GCE O/CSE Physics, six programs £6.50; chemistry six programs £6.50 or both tapes £12. Think Tank, Dept. PCW, 35 Wellington Road, Wimbledon Park, London SW19 8EQ.

UTILITIES

SPECTRUM TRADE SECRETS. New booklet includes how to make programs unstoppable, unlistable, invisible. How to reveal such. With hints/tips and Microdrive supplement, £3. ZX-GUARANTEED, 29 Chadderton Drive, Unsworth, Bury, Lancs.

DRAGON/32 BBC MODEL/B ATARI 400/800 C/C 32K ELECTRON
747 FLIGHT SIMULATOR
 Superbly realistic instrumentation and pilot's view in lifelike simulation which includes emergencies such as engine fires and systems failures. This program uses high resolution graphics to the full to produce the most realistic flight-deck display yet seen on a home computer. There are 21 real dials and 25 other indicators (see diagram). Your controls operate throttle, ailerons, elevators, flaps, slats, spoilers, landing gear, reverse thrust, brakes, etc. You see the runway in true perspective. Uses joysticks and includes options to start with take-off or random landing approach. "A real simulation, not just another game" (*Your Computer*, April 19, 1983).
 "The cockpit display is impressive" (*Which Micro*).
Cassette £9.95 (p&p and VAT included):
DACC Ltd (Dept. PCW)
 23 Waverley Road, Hindley, Greater Manchester WN2 3BN
 (Despatch within 48 hours)

★ ★ TAPE COPIER ★ ★

You need a BACK-UP copier to protect YOUR Spectrum. Our package copies ALL types of programs easily with many unique features. **MICRODRIVE COMPATIBLE**, we are so convinced of the professional quality of our product we offer a **FULL MONEY BACK GUARANTEE** if you are not satisfied.

- * LOADS in all program parts (no limit) CONTINUOUSLY — even without pressing a key. Most copiers require many loadings — MASSIVELY saving you time and trouble!
- * Copies ALL programs that we are aware of (headerless/mc/etc);
- * Break at any time — just copy a "header" if you like!
- * First class post + updates at £1.50.
- * Verifies, Repeat copies. Abort (change your mind). STOPS programs.
- * Maxcopy makes a working copy of the full 16K or 48K! Gives program name.
- * FULL user instructions but the package is VERY SIMPLE to use.

Cost £4.50

MASSIVELY IMPROVE ALL YOUR SPECTRUM PROGRAMS

using our GRAPHICS AND SOUND TOOLKIT

- Write impressive GAMES, or smarten up your other programs with PROFESSIONAL machine code effects. Yes m/code at your fingertips called from BASIC. No knowledge of m/c required!
- * Over 80 routines including PIXEL scrolls — all directions — wrap around.
 - * Character rotates and reflects, border effects, screen inverts. BOX fill.
 - * Sound, memory left, etc, etc. DEMO tape and FULL MANUAL.
 - * Easy to use, and relocatable in memory. **ONLY £5.50** (not the usual £10+).

If you've ever been killed by the evil goblin, flamed by a dragon or turned to stone by a wizard...

then you need Micro Adventurer — the new monthly magazine devoted to all microcomputer adventures, war games and simulations.

Each issue offers a wide range of stimulating features, including:

- Helpline and Contact columns
- Reviews of the latest adventures
- Competitions with exciting prizes
- War gaming advice
- Adventures to type in and play
- Profiles of famous adventurers
- Advice on how to write your own adventures

If all this sounds too good to be true then fill in the form below to make sure you receive your copy of Micro Adventurer.

SUBSCRIPTION ORDER FORM

Please send me 12 issues (a year's subscription) of Micro Adventurer, beginning with the _____ issue.

Address _____

Signature _____ Date _____

This order should be accompanied by a cheque made payable to Micro Adventurer.

UK subscribers

A year's subscription is £10.00 — please send this form with payment to Micro Adventurer, Subscriptions Department, Oakfield House, Perrymount Rd, Haywards Heath, Sussex.

US/Canadian subscribers

A year's subscription at air-speeded rates is US\$33.95 — please send this form with payment to Micro Adventurer, c/o Business Press International, 205 East 42nd St., New York, NY 10017.

NEW RELEASES

SCALE DOWN

Although it's called *Logo-art*, this new program from Hobby Software has relatively little to do with the famous language used with Turtles and the like.

In fact *Logo-art* is an *Artists Designer*-type program, albeit one with a good many features.

For the Dragon 32, it allows you to draw in any *Pmode* and Save your creation to tape. Apart from the usual draw/erase line features there is a choice of scaling, ie, how far the line moves for each instruction, down to a single pixel point.

Program *Logo-art*
Price £6.95
Micro Dragon 32
Supplier Hobby Software

Chapel House Estate
Newcastle upon Tyne
NE5 1HZ

OPENING TIME

Pi-Eyed is the latest in Automata's growing range of arcade games for the Spectrum. As ever it refrains from violence and concerns itself instead with the serious business of drinking — something dear to the Piman's heart (he must be a journalist).

The game is not likely to give Ultimate any sleepless nights, at least not technically, but it is good fun for all that.

Using the cursor keys you move the Piman along a road full of traffic (a bit like *Frogger* — *Pigger* perhaps?) to evade the traffic he can enter

one of the buildings that flash past — surprisingly, most of these seem to be pubs.

Once in a pub the Piman must drink all the pints on the table — this makes him drunk and difficult to control, consequently he falls over everyone; this loses points.

Other locations simply produce funny (fairly) messages and the aim of the game is really to last as long as you can.

Program *Pi-Eyed*
Price £6
Micro Spectrum 48K
Supplier Automata
27 Highland Road
Portsmouth
Hants PO4 9DA

NOTATION

Vectors was one of those mathematical concepts that I never really mastered — maybe what I needed was *Vectors* by Salamander Software.

This package is a collection of 14 programs which cover most of the vector algebra required for 'A' level maths.

Subjects include Scalar multiplication, matrix notation, modulus, ratio theorem and many others.

The 14 programs develop logically on from one another and were written by a senior lecturer in mathematics.

The programs can be saved to disc should you have one and will work on both the BBC B and the Electron.

Program *Vectors*
Price £24.95
Micro BBC B/Electron
Supplier Salamander
17 Norfolk Road
Brighton
East Sussex
BN1 3AA

WIDE-EYED

Astronomy fans should get hours of wide-eyed entertainment from *The Cosmos* by Eclipse Software.

This program attempts to display the entire Cosmos on your 48K Spectrum from next door neighbours like the Virgo Cluster — a mere 2,000 light years away — to remote regions like the Hydra Cluster.

Program *The Cosmos*
Price £5.95
Micro Spectrum 48K
Supplier Eclipse Software
79 Ardrossan Gdns
Worcester Park
Surrey KT4 7AX

AROUND SPACE

The galaxy is yours to explore in *Megawarz* a 'magical planetary trip' which takes you from Pluto to Mars battling it out with various aliens whose degree of vulnerability to your firepower is illustrated by their colour which changes periodically.

Your ship comes equipped with shields which have to be replenished from time to time by capturing astronauts who, for some reason, are hurtling through space towards you.

Movement is either by joystick or the keyboard and you can select the difficulty level and adapt the game to make it more or less difficult.

The first round ends when you have destroyed aliens in every corner of the galaxy and arrived back at the earth and then — guess what? It all starts again, faster and meaner.

Program *Megawarz*
Price £7.50
Micro Commodore 64
Supplier Paramount Software
67 Bishopton Lane
Stockton-on-Tees
TS18 1PU

TIME LORDS

If unbelievably difficult text adventures appeal to you then you are bound to react with glee to the news that Level 9 has just issued its latest epic — *Lords of Time*.

Nine evil timelords are out to cause chaos throughout human history. Using a mysterious clock you must travel through nine different periods of time looking for the nine special objects which together will save eternity.

The adventure is being issued for seven different machines and is entirely in machine code. Responses are fast and, even more important, Level 9 have thought about a suitable response for when you haven't typed in the right thing, other than "I don't understand". Another winner.

Program *Lords of Time*
Price £9.90
Micro Most (32K +)
Supplier Level 9 Computing
229 Hughenden Road
High Wycombe
Bucks HP13 5PG

BLOCKED MAZE

Skull is a machine code maze game for the Spectrum 48K. The only objective of the game is to stay alive as long as possible and accumulate as many points as possible. This is achieved by finding various treasures that are scattered about the maze.

Problems take the form of nasty skulls that will defend the treasure. You may also find that your way through the maze is suddenly blocked by a portcullis that can only be raised by a special key.

The 3-D views through the maze are very well done — in a similar way to *Transylvanian Tower* by Richard Shepherd — and also like that game you can elect to view a map of what's located where, but you

need to have a good memory as it dissolves within a couple of seconds. Very enjoyable with lots of tactical play possible.

Program *Skull*
Price £6.95
Micro Spectrum 48K
Supplier Games Machine
Bessemer Drive
Stevenage
Herts SG1 2DX

SINGLE PIXEL

A very nice idea this; *Dataid* is a Dragon graphics program that comes not only with a manual but also a specially designed protractor and ruler.

The program itself is a fairly standard drawing program with fill and a choice of movement detail — from single pixel to 20 pixels. But the ruler and protractor look really useful in enabling accurate plotting on the high resolution screen.

The whole package is neatly put together and anything you create can be *Saved* for use in your programs. The price is reasonable too.

Program *Dataid*
Price £10.95 (+£1.00)

EIGHT WAVES

More arcade action for the Oric 48K. *Starship* from Sector 7 Software would seem to have all the necessary require-

ments for the genre — eight waves of different aliens, machine code etc.

On this particular game you are required to defend earth (armed only with three gigantic battlecruisers) from a massed onslaught by the war fleet of the Cirellian Empire.

Apart from high score tables the game has an added feature not often seen on Oric games — it loads a pretty title screen for you to look at, whilst the Oric is taking its usual interminable time to load.

Program *Starship*
Price £6.50
Micro Oric 1 48K
Supplier Sector 7 Software

Newton Abbot
Devon
TQ12 1UE

MORTGAGE

Vic Money Manager is one of Ivan Berg Software's growing range of utility packages for the Vic20 plus 8 or 16K.

The box contains two cassettes and a manual. The main program is *Money Manager* which is a fairly straightforward accounts program allowing you to keep records of bank statements, tax demands, etc, recording the main details with the relevant dates.

There are facilities to get a balance of your account and to credit regular income payments. You may also list standing orders and compare actual and estimated expenditures.

The second tape is *Money Calculator* which contains programs for mortgage and interest calculation.

Program *Vic Money Manager*
Price £9.99
Micro Vic20 (8K/16K)
Supplier Commodore
675 Ajax Avenue
Slough Trading Estate
Slough
Berks SL1 4BG

ENERGY LEVEL

Krago Castle is an adventure game with strategy overtones. Although a lot of the time you concern yourself with secret

passages and locked doors, whilst wondering what effect drinking the mysterious potion is going to have, you also have to maintain your energy for frequent bouts of combat with nasty monsters.

Although there are a couple of nice title screens, most of the action is text only — mainly Basic with machine code subroutines — a quick play suggested there were quite a few clever ideas in the game.

Program *Krago Castle*
Price £6.00
Micro Spectrum 48K
Supplier Assassin Software
10 Ash Road
Leeds 6

GRAPHICS AID

Print 'n' Plotter originally produced a range of practical aids for Spectrum program development in the form of large sheets of lined paper which mimicked the layout of the pixels on the Spectrum screen.

It has now issued a program that looks just as useful. *Paintbox* is basically a very sophisticated designed program. The potentially very impressive results are illustrated in both the adds and the helpful manual that comes with it.

The advantage of *Paintbox* is that like other similar programs it allows you 'etch a sketch' like facilities but it also gives you up to 84 user defined graphics with each design — especially useful for interesting type faces. If you've been looking for a Spectrum graphics aid, this seems like one of the best.

Program *Paintbox*

Price £7.50 (p+p 75p)
Micro Spectrum 48K
Supplier Print 'n' Plotter
Products
19 Borough High Street
London SE1 9SE

SUN TRAP

Here Comes the Sun is a graphics adventure from Alligata Software who have previously concentrated on BBC, Commodore and Dragon programs — this one is for the Spectrum.

The general plot sounds a little like *Artic's Ship of Doom* — you have to find your way to the retro rockets of a ship and activate them before you are dragged into the sun.

The program is supposed to be extremely difficult and will allow inputs other than *Take X* or *Drop Y* like *The Hobbit*.

Although hi-res, the graphics are fairly simple, but sound is used to good effect — one the hardened text adventurer will enjoy.

Program *Here Comes the Sun*
Price £7.95
Micro Spectrum 48K
Supplier Alligata Software
178 West Street
Sheffield S1 4ET

Book Ends

POCKET SIZED

Assembly Language for the Z80 is the latest in Pitman's Pocket Guide Series — neatly designed instruction books that actually will fit in a pocket.

Although not machine specific — and so it would probably need to be supplemented by more specific information should you actually wish to get down to some serious programming — it is nevertheless one of the most useful books on this subject I have seen.

The wonderful world of registers, stacks, unconditional jumps and relative addressing are described and explained in a fair amount of detail and the book, if that's the right description, seems excellent value for money.

Book *Assembly Language for the Z80*
Price £2.50

DISC DRIVES

Whilst it is easy to see that general introductions to micros might sell well to all kinds of people, I am not sure there is an equivalent size of market for a general book on disc drives. Nevertheless *Disc Drives for Microcomputers* is just that.

This slim volume attempts to provide a general outline on how disc drives work and guidance on how to write programs that use them effectively. A number of programs are included in the book, although for many machines they will need some adaptation.

This Week is a new section that covers all the new software coming on to the home micro market each week. All suppliers should send details of their new programs to: This Week, Popular Computing Weekly, 12-13 Little Newport Street, London WC2R 3LD.

Plug-compatible

Two computers with 16-bit microprocessors, both costing around £400 are due on the market in a short while — the Sinclair QL and the Advance 86a.

The two machines follow differing design philosophies, and the two approaches are very familiar to those whose experience extends to the world of main-frame computers. They are the "plough your own furrow" and the "plug-compatible" schools of thought.

For many years main-frame manufacturers have either decided to make their products compatible with IBM (plug-compatible products such as Amdahl), or decided to make their own way with products so distinctly excellent that they will be purchased in preference to IBM (eg. Honeywell or ICL).

With IBM becoming dominant in the upper reaches of the micro business market with its PC and now PCjr, the trend with low cost "professional" machines is set to follow the same path as the main-frames. Any manufacturer has to think very carefully about IBM before launching a new micro.

By choosing Motorola for the 16-bit chip, incorporating microdrives on-board, designing its own Basic and operating system, Sinclair Research seems to have chosen to be a Honeywell rather than an Amdahl.

Sinclair Research has been very successful in the past in producing highly novel, idiosyncratic products — trail-blazers in fact. It has been said that if Sinclair did not exist, then somebody would have had to invent him. What was meant was that Sinclair added a sense of the magical

to personal computing: though he had a good team, his personality was the driving force behind it.

In moving into a new sector of the market, and one which is already well supplied with machines, Sinclair Research is not in the same position of advantage it was with their small computers. A product has to be very good to sell to the serious user. However, at about £400 many "non-serious" users bought the BBC model B, and possibly that is the market for the QL, the upmarket personal user.

We know very little about the Advance, but we do know that it is a plug-compatible computer (ie, compatible with the IBM PC). The designers of the Advance took a design decision at the start to be plug-compatible with the IBM PC. In a similar way, in the world of mainframes, Amdahl and Hitachi design computers and peripherals so that IBM software and add-ons work without modification.

The way in which Amdahl and Hitachi sell their plug-compatible products is to make them cheaper, and faster, and anything else to give them an edge over IBM. Plug-compatible manufacturers are not trying to drive IBM out of business, because if IBM folded so probably would the plug-compatible manufacturers. IBM "look alikes" are only viable if IBM is still the dominant computer manufacturer, because who wants to be a look-alike to a manufacturer whose products do not sell well?

The Advance is IBM PC compatible, is faster, and — according to somebody who has used a pre-production version — is a nice machine to use. The Advance uses the Intel 8086 chip (the IBM PC uses the 8088), and so is an advance, (no humour intended) on the IBM in terms of technology.

With the QL and the Advance we have two very cheap 16-bit machines with two opposing views of the market and it should be very interesting to see how they fare.

Why is the IBM PC so popular (though it costs far more than, say, the Sirius)? The reason is simple. You can trust the IBM, they will not fold overnight, and when they enhance their machines they always ensure that old software will run on the new machines.

How many other personal computer manufacturers can say that?

■ Boris Allan

Puzzle

Sale bargains

Puzzle No 92

Sue Sails went to the sales to buy a new electric toaster, and came back with many wondrous things — but not, I ought to add, the toaster!

It turned out that she had bought 25 items and had spent exactly £25 on the four types of goods listed.

Bath towels.....	two for £1
Tablecloths.....	£1 each
Saucepans.....	two for £5
Sets of cutlery.....	£5 each

How many of each had she bought?

Solution to Puzzle No 87

If the addition sum is examined, it is seen that if we assign values to the letters 'N' and 'S' we can immediately find out the value of 'A'. Once this is known, the value of 'T' can likewise be determined. This enables us to reconstruct the complete sum and check if any of the possible results match up.

```
10 FOR N = 0 TO 9 20 FOR S = 0 TO 9 30 IF N = S
  THEN GOTO 160 40 LET X$ = STR$(N + 2 * S) 50
  LET A + VAL(X$(LEN X$)) 60 IF A = S OR A = N
  THEN GOTO 160 70 LET X$ = STR$((N * 10 + N) +
  (N * 10 + S) + (N * 10 + S)) 80 IF LEN X$ < 2 THEN
  LET X$ = "0" + X$ 90 LET T = VAL(X$(LEN X$ -
  1)) 100 IF T = A OR T = N OR T = S THEN GOTO
  160 110 LET ANN = A * 100 + N * 10 + N 120 LET
  TANS + T * 1000 + A * 100 + N * 10 + S 130 LET
  STANS = S * 10000 + TANS 140 LET SANTA = S *
  10000 + A * 1000 + N * 100 + T * 10 + A 150 IF ANN
  + TANS + STANS + SANTA THEN PRINT S;A;N;T;A
  160 NEXT S 170 NEXT N
```

From this the only solution is: S = 4, A = 5, N = 7 and T = 2, giving 577 + 2574 + 42574 = 45725.

Winner of Puzzle No 87

The winner is: G Loveridge, Usk Road, Pontypool, Gwent, who receives £10.
